You are to configure your set of 5 routers and implement the 192 and 193 networks as described on the attached handouts. After you have the configurations implemented, tested and working correctly, you will build a web page for your solution. You should include diagrams, configuration code and a written explanation of how your access lists work. Include sample addresses that will succeed and fail for each condition being tested by your access list. Give a brief explanation of how you tested the condition and why each of the addresses failed or succeeded.
